

Proficiency Test 2

Ashay Joshi

Task 1

```
for(x in mtcars$mpg[1:3]) {  
  print(x)  
}
```

```
[1] 21  
[1] 21  
[1] 22.8
```

Task 2

```
count_above <- function(numeric_vector, cutoff_value) { # creates the function with numeric  
  count <- 0 # sets the initial count to 0  
  
  for (i in 1:length(numeric_vector)) { # creates a for loop to iterate through the vector  
    if (numeric_vector[i] > cutoff_value) { # this is a selection statement to see whether t  
      count <- count + 1 # adds 1 to the count if the observation is greater than the cutoff v  
    }  
  }  
  return(count) # returns the count  
}
```

```
count_above(iris$Sepal.Length, 6)
```

```
[1] 61
```

```
count_above(mtcars$disp, 150)
```

```
[1] 20
```

Task 3

Making functions essentially means that certain functions will perform different tasks when in the presence of certain packages. For example when the dplyr function is present, some of the functions in base R will not perform the same tasks, because the package defines those same functions differently.
